Handbook of Research Design in Mathematics and Science Education - Anthony Edward Kelly 2012-10-12

The Handbook of Research Design in Mathematics and Science Education is based on results from an NSF-supported project (REC 9450510) aimed at clarifying the nature of principles that govern the effective use of emerging new research designs in mathematics and science education. A primary goal is to describe several of the most important types of research designs that: * have been pioneered recently by mathematics and science educators; * have distinctive characteristics when they are used in projects that focus on mathematics and science education; and * have proven to be especially productive for investigating the kinds of complex, interacting, and adapting systems that underlie the development of mathematics or science students and teachers, or for

the development, dissemination, and implementation of innovative programs of mathematics or science instruction. The volume emphasizes research designs that are intended to radically increase the relevance of research to practice, often by involving practitioners in the identification and formulation of the problems to be addressed or in other key roles in the research process. Examples of such research designs include teaching experiments, clinical interviews, analyses of videotapes, action research studies, ethnographic observations, software development studies (or curricula development studies, more generally), and computer modeling studies. This book's second goal is to begin discussions about the nature of appropriate and productive criteria for assessing (and increasing) the quality of research proposals, projects, or publications that are based on the preceding kind of research designs. A final objective is to

describe such guidelines in forms that will be useful to graduate students and others who are novices to the fields of mathematics or science education research. The NSF-supported project from which this book developed involved a series of mini conferences in which leading researchers in mathematics and science education developed detailed specifications for the book, and planned and revised chapters to be included. Chapters were also field tested and revised during a series of doctoral research seminars that were sponsored by the University of Wisconsin's OERI-supported National Center for Improving Student Learning and Achievement in Mathematics and Science. In these seminars, computer-based videoconferencing and www-based discussion groups were used to create interactions in which authors of potential chapters served as "guest discussion leaders" responding to questions and comments from doctoral students and faculty members representing

more than a dozen leading research universities throughout the USA and abroad. A Web site with additional resource materials related to this book can be found at <http://www.soe.purdue.edu/smsc/lesh/> This internet site includes directions for enrolling in seminars, participating in ongoing discussion groups, and submitting or downloading resources which range from videotapes and transcripts, to assessment instruments or theory-based software, to publications or data samples related to the research designs being discussed.

Mathematics Education in Different Cultural Traditions- A Comparative Study of East Asia and the West - Frederick Koon-

Shing Leung 2006-08-02

The idea of the ICMI Study 13 is outlined as follows:

Education in any social environment is influenced in many ways by the traditions of these environments. This study brings together leading experts to research and report on mathematics education in a global context. Mathematics education faces a split phenomenon of difference and correspondence. A study attempting a comparison between mathematics education in different traditions will be helpful to understanding this phenomenon.

How Writing Shapes Thinking - Judith A. Langer 1987

In the belief that effective writing instruction can be a critical component in

successful learning, and to better understand the role that writing plays in content area learning, this book presents an extensive study of writing assignments in the secondary school curriculum. Following an introduction, the book provides an overview of the project, chapters 1 and 2 highlighting the data gathered and analytical methods used. The third chapter of the book provides a detailed introduction to the observations of teachers and their students, with some general findings about ways in which they used writing in the teaching of academic subjects. The fourth chapter describes the types of writing activities that worked in aa variety of content-area classrooms. Chapter 5 shifts focus away from the activities provided and toward the redefinition of teaching and learning that occurred in the classrooms where writing worked best to foster learning. Chapters 6 through 8 examine the kinds of thinking promoted by different types of writing in the

classroom. The final chapter brings together concerns about the roles of teacher and learner in the instructional interaction, providing a theoretical framework, practical suggestions for an alternative model of instruction, and a discussion of the constraints that must be addressed if wide-scale use of writing to support learning is to become a reality. A five-page reference list and two appendices are included. (HTH)
