Introduction to Statistics (Package) - Carmine DeSanto 2008-08-01

Introduction to Statistics provides a first exposure to elementary statistics for liberal arts students nationwide. The textbook includes a focus on technological skills to increase statistical literacy, with detailed explanations presented in an easy conversational writing style. The text uses a step-by-step problem-solving approach that helps students understand complex statistical concepts, while incorporating educational trends that stress student understanding of basic statistical concepts with the help of technological devices. Suitable for use in a one- or two-semester course, the text contains fourteen chapters of descriptive statistics, probability, probability distributions, various models of hypothesis testing, and linear regression. Interpretation of calculator and statistical software output is integrated throughout the text, and numerous problem sets offer questions that both test basic statistical concepts and challenge students' critical thinking skills. In production and revision for some thirty-seven years, the eighth edition of Introduction to Statistics scales down the physical text and supplements it with a web site (http://www.pearsoncustom.com/ny/ncc_statistics) that offers both students and instructor access to a wealth of online teaching materials.

Applied Statistics for Civil and Environmental Engineers - N. T. Kottegoda 2008-08-04

Civil and environmental engineers need an understanding of mathematical statistics and probability theory to deal with the variability that affects engineers' structures, soil pressures, river flows and the like. Students, too, need to get to grips with these rather difficult concepts. This book, written by engineers for engineers, tackles the subject in a clear, up-to-date manner using a process-orientated approach. It introduces the subjects of mathematical statistics and probability theory, and then addresses model estimation and testing, regression and multivariate methods, analysis of extreme events, simulation techniques, risk and reliability, and economic decision making. 325 examples and case studies from European and American practice are included and each chapter features realistic problems to be solved. For the second edition new sections have been added on Monte Carlo Markov chain modeling with details of practical Gibbs sampling, sensitivity analysis and aleatory and epistemic uncertainties, and copulas. Throughout, the text has been revised and modernized.
