Assessing Competence in Professional Performance across Disciplines and Professions - Paul F. Wimmers 2016-04-19

This book examines the challenges of cross-professional comparisons and proposes new forms of performance assessment to be used in professions education. It addresses how complex issues are learned and assessed across and within different disciplines and professions in order to move the process of "performance assessment for learning" to the next level. In order to be better equipped to cope with increasing complexity, change and diversity in professional education and performance assessment, administrators and educators will engage in crucial systems thinking. The main question discussed by the book is how the required competence in the performance of students can be assessed during their professional education at both undergraduate and graduate levels. To answer this question, the book identifies unresolved issues and clarifies conceptual elements for performance assessment. It reviews the development of constructs that cross disciplines and professions such as critical thinking, clinical reasoning, and problem solving. It discusses what it means to instruct and assess students within their own domain of study and across various roles in multiple contexts, but also what it means to instruct and assess students across domains of study in order to judge integration and transfer of learning outcomes. Finally, the book

examines what it takes for administrators and educators to develop competence in assessment, such as reliably judging student work in relation to criteria from multiple sources. "... the co-editors of this volume, Marcia Mentkowski and Paul F. Wimmers, are associated with two institutions whose characters are so intimately associated with the insight that assessment must be integrated with curriculum and instructional program if it is to become a powerful influence on the educational process ..." Lee Shulman, Stanford University

Statistical Process Control - Stephen Mundwiller 2017-10-24

People with minimal math skills, and even those with advanced math skills, have difficulty grasping the intuitive concepts behind Statistical Process Control (SPC). Many practitioners do not understand the concepts behind Control Charts, the differences of out of control and out

of specification, and the process variation on Control Charts. This book will explain these concepts by using a simple methodology that will bring a much greater level of understanding to those that use it by providing a detailed description of the method, using common language, real-world examples to illustrate the concept, and instructions on easy implementation.

Quality Improvement - Dale H. Besterfield 2012-01

Formerly titled Quality Control, the field's most accessible introduction to quality has been renamed and revamped to focus on quantitative aspects of quality improvement. New chapters on Lean Enterprise, Six Sigma, Experimental Design, and Taguchi's Quality Engineering have been added, and this new Ninth Edition adds comprehensive coverage of fundamental statistical quality improvement concepts. A practical state-of-the-art approach is stressed throughout, and sufficient theory is presented to ensure that students develop a solid understanding of basic quality principles. To improve accessibility, probability and statistical techniques are presented through simpler math or developed via tables and charts. As with previous editions, this text is written to serve a widely diverse audience of students, including the growing number of "math shy" individuals who must play key roles in quality improvement. Program Planning and Evaluation for the Public Manager - Ronald D. Sylvia 2012-03-21

In an era of rapidly shrinking resources, efficient utilization of public resources is of paramount importance. Health care, social services,

education, law enforcement, and other fields have established their own standards against which program operations are assessed. National accrediting bodies have implemented systems of rigorous peer review to ensure the quality of program processes and outcomes.

Nongovernmental organizations must demonstrate success in achieving their stated goals in order to sustain or expand program funding. In the 21st century, process (how programs are organized and how work is conducted) has become as important as outcomes in determining program effectiveness. Responding to these dynamic challenges, the authors utilize concrete case studies to immerse students in the techniques of program evaluation. They effectively examine systems theory, project planning, queuing theory, cost-benefit analysis, and organization processes (including standards-based program accreditation), providing practical examples in an easy-to-comprehend style. In addition, comprehensive discussions explain how process intervention is utilized to achieve program adaptations and strategic change. Like its highly regarded predecessors, the latest edition features evaluation exercises designed to facilitate student development of indicators and measures when dealing with real-world programs. An Instructors Manual provides solutions to the case studies in the appendix of the text, further clarifying the program planning and evaluation process.

Cognition, Metacognition, and Culture in STEM Education - Yehudit Judy Dori 2017-12-01

This book addresses the point of intersection between cognition, metacognition, and culture in learning and teaching Science, Technology, Engineering, and Mathematics (STEM). We explore theoretical background and cutting-edge research about how various forms of cognitive and metacognitive instruction may enhance learning and thinking in STEM classrooms from K-12 to university and in different cultures and countries. Over the past several years, STEM education research has witnessed rapid growth, attracting considerable interest among scholars and educators. The book provides an updated collection of studies about cognition, metacognition and culture in the four STEM domains. The field of research, cognition and metacognition in STEM education still suffers from ambiguity in meanings of key concepts that various researchers use. This book is organized according to a unique manner: Each chapter features one of the four STEM domains and one of the three themes—cognition, metacognition, and culture—and defines key concepts. This matrix-type organization opens a new path to knowledge in STEM education and facilitates its understanding. The discussion at the end of the book integrates these definitions for analyzing and mapping the STEM education research.
